A Practical Deep Learning–Based Acoustic Side Channel Attack on Keyboards

Joshua Harrison, Ehsan Toreini, Maryam Mehrnezhad

With recent developments in deep learning, the ubiquity of micro-phones and the rise in online services via personal devices, acoustic side channel attacks have become a greater threat to keyboards than ever. This paper presents a practical implementation of a state-of-the-art deep learning model in order to detect keystrokes using a smartphone integrated microphone. When trained on keystrokes recorded by a nearby phone, the classifier achieved an accuracy of 95% seen without the use of a language model. When trained on keystrokes recorded using the video-conferencing software Zoom, an accuracy of 85% was achieved, the best for the medium. Our results prove the practicality of these side channel attacks via off-the-shelf equipment and algorithms. We discuss various methods to protect users against these series of attacks.

Building An Acoustical Keystroke Logger

ML Audio Classification?

- MANY Doing This!
- Spectrogram Comparison
 - Visual Representation
 - Similarities Visually
- Example Projects:
 - Cats vs Dogs
 - Environmental Sounds
 - Gunshot Recognition

Always Starts w/ The Dataset...

- Keystroke-noiseless-final dataset
 - "Sonotype" challenge at Singapore AI CTF 2024
 - Same problem...
- Multi-Keyboard Acoustic (MKA) Dataset
 - Previous Attempt At This
 - Persistent Inherent Limitations
 - Doesn't Encompass Complexity of Real-World Scenarios
- Will Provide Datasets In GitHub

Data Processing Pipeline

Recordings → Spectrogram Images

- Directory Name → Classification
- Labels (A-Z, 0-9, Sp, Ent) = 38
- Frequencies Over Time
- RGB (3 channels)
- Resized to a Fixed Grid Data Pipeline
- Normalization (Color + Brightness)
- Robust (Time Shift + Blank Mask)
- Train on "Features" Within The PNG

Model Training

CoAtNet-style Architecture

- Local Patterns, Global Context
- Loss = Cross Entropy
 - Multi-Class Classification
- Uncommon High Epochs (1200)
 - LR $5e-4$, Linear Annealing
 - Optimizer: AdamW (Adam + Weight Decay)
- Compute Train Loss + Train Accuracy Per Epoch

Acoustic Key Detection (Single)

- WAV for Training, Validation, Test Are All The Same!

Demo: Correcting Probabilities

<https://youtu.be/eXPG-IM3j5M>

Demo: Using AI To Enhance

https://youtu.be/_MG1q0g1-8w

Results From Both Experiments

Single Keyboard

- Accuracy: **100%**

Multiple Keyboards

- Accuracy (Exact): **46%**
- Even Distribution: 3%
 - Random: 1 out of 38

Additional Considerations:

- TopK > 1, Confid. Scores
- All Permutations
- AI to "Fill In The Blanks"

Keystroke Independent Dataset
